Routing Through Networks - 2

Hamiltonian Path Problem

- Assume a network with all possible arcs – called complete graph
- Hamiltonian Circuit (path, graph) – a path that visits each node exactly once
- Find the path that minimizes total “distance” written on the arcs.
- An approach: Brute-force approach (total enumeration) Try every unique circuit

Eulerian Cycle Problem

- Eulerian Circuit (path, graph) – a path that visits each edge exactly once

On Eulerian Cycles

The degree of a node in an undirected graph is the number of incident arcs

Theorem. An undirected graph has an eulerian cycle if and only if

- (1) every node degree is even and
- (2) the graph is connected (that is, there is a path from each node to each other node).

Eulerian Cycle Problem

- Fleury's algorithm

Video: 4,55 min

<https://www.youtube.com/watch?v=Lr6C8u-FDL8>

Shortest Path Problem

Performance measure that can be used:

- distance traveled
- cost
- time
-

Performance measure is whatever the number on the arc represents.

Minimize one of the above

Shortest Path Problem

- o We have a systematic method to solve the problem, an algorithm (a detailed procedure – Dijkstra's Algorithm)
 - o What is the meaning of optimal solution?
A solution that yields the minimum value of the performance measure considered
- VERY LUCKY TO KNOW/PROVE IF THE ALGORITHM YIELDS AN OPTIMAL SOLUTION

Dijkstra's Algorithm

Edsger Wybe Dijkstra

- May 11, 1930 – August 6, 2002
- Dutch computer scientist from Netherlands
- Received the 1972 A. M. Turing Award, widely considered the most prestigious award in computer science
- Known for his many essays on programming

Simplicity is prerequisite for reliability.
(Edsger Dijkstra)

Dijkstra's Algorithm

General Description

Suppose we want to find a shortest path from a given node s to other nodes in a network (

- Node s is called a starting node or an initial node
- Dijkstra's algorithm starts by assigning some initial values for the distances from node s and to every other node in the network
- It operates in steps, where at each step the algorithm improves the distance values.
- At each step, the shortest distance from node s to another node is determined

An Example

Initialize

Select the node with the minimum temporary distance label.

Update Step

Choose Minimum Temporary Label

Update Step

The predecessor
of node 3 is now
node 2

Choose Minimum Temporary Label

Update

d(5) is not changed.

Choose Minimum Temporary Label

Update

d(4) is not changed

Choose Minimum Temporary Label

Update

d(6) is not updated

Choose Minimum Temporary Label

There is nothing to update

End of Algorithm

All nodes are now permanent

The predecessors form a tree

The shortest path from node 1 to node 6 can be found by tracing back predecessors

Exercise for Wednesday and Thursday

Assignment Problem

- n tasks – n workers
- A worker is assigned only one task
- Each task is assigned to a single worker
- “Cost” of performing a task is a function of the worker and task.
- Examples:
 - tasks / workers at Mini
 - jobs/employees at airport
 - lawyers/cases
 - students/topics
 - swimmers/strokes for medley

Assignment Problem – as a network

Solution

- Matrix representation of costs

Workers Tasks	1	2	...	n
1	c_{11}	c_{12}		c_{1n}
...				
n	c_{n1}	c_{n2}		c_{nn}

- One of the lucky cases
- Hungarian Algorithm
- We'll see Wednesday and Thursday in class

A few ideas on the problem

- Minimize total cost
- Only one worker for a task, one task for a worker
 - (1) Find the minimum for each row and add – Is it possible to have total cost less than that?
 - (2) Find the minimum in each column and add - Is it possible to have total cost less than that?
- Both are lower bounds on the optimal cost

KAHOOT

Q1) A good algorithm for finding an eulerian path is:

a) Dijkstra b) Nearest Neighbour c) 2-opt d) Fleury's (dogrusu d)

Q2) A graph has an eulerian path if and only if all degrees are even and connected

True

Q3) Diskstra's algorithm is a heuristic approach for finding shortest path problem

False

Q4) In Dijkstra's algorithm, if a node is labeled with a distance it will never get changed

False

Q5) Hungarian method solves

a) shortest path problem, b) Eulerian path problem c) Assignment problem d) Hamiltonian path problem
